

Transient Simulation of an EMAT

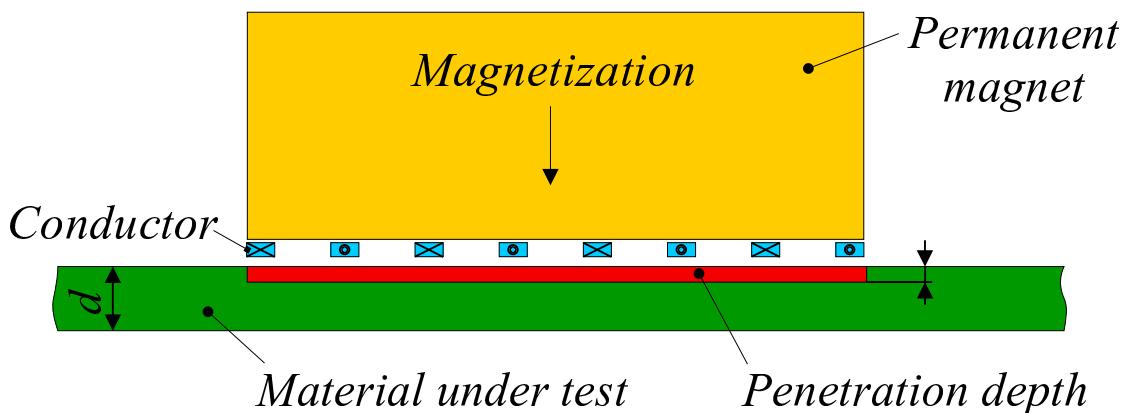

Setup for plate wave generation

Quality control of rolled aluminium

2D Simulation Model of the Transmitting EMAT

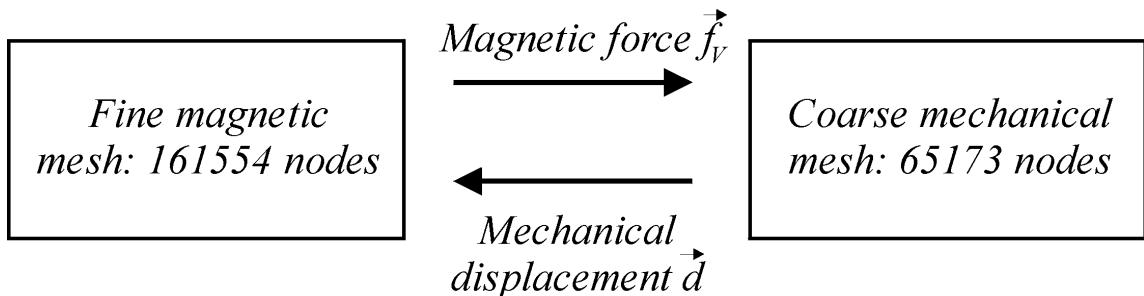

Penetration depth (Aluminium, $f=1.8$ MHz):

$$\delta = \frac{1}{\sqrt{\pi \gamma_{Alu} \mu_{Alu} f}} = 63.4 \mu m$$

Mechanical wavelength:

$$\lambda_{mech} = \frac{c_{mech}}{f} = 1667 \mu m$$

→ Different FE grids for the mechanical and the magnetic field problem

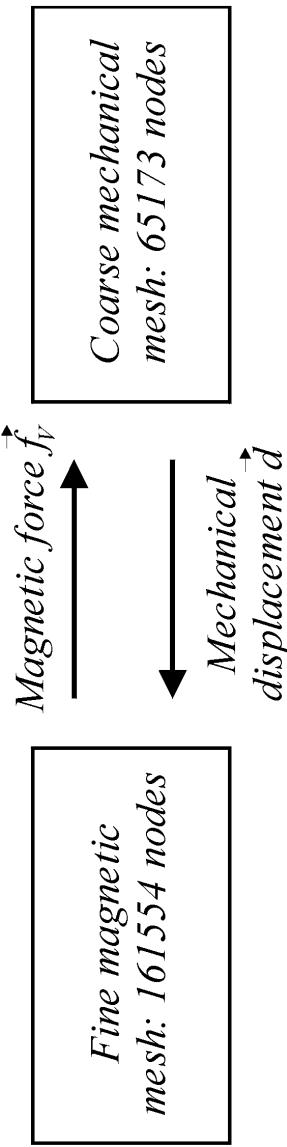

Problems in this simulation

$$\left. \begin{array}{c} \text{Penetration depth} \\ = 63.4 \text{ m} \end{array} \right\} \xrightarrow{\text{VS.}} \left. \begin{array}{c} \text{Mechanical wavelength} \\ 1667 \text{ m} = \text{mech} \end{array} \right\}$$

Solution with our software

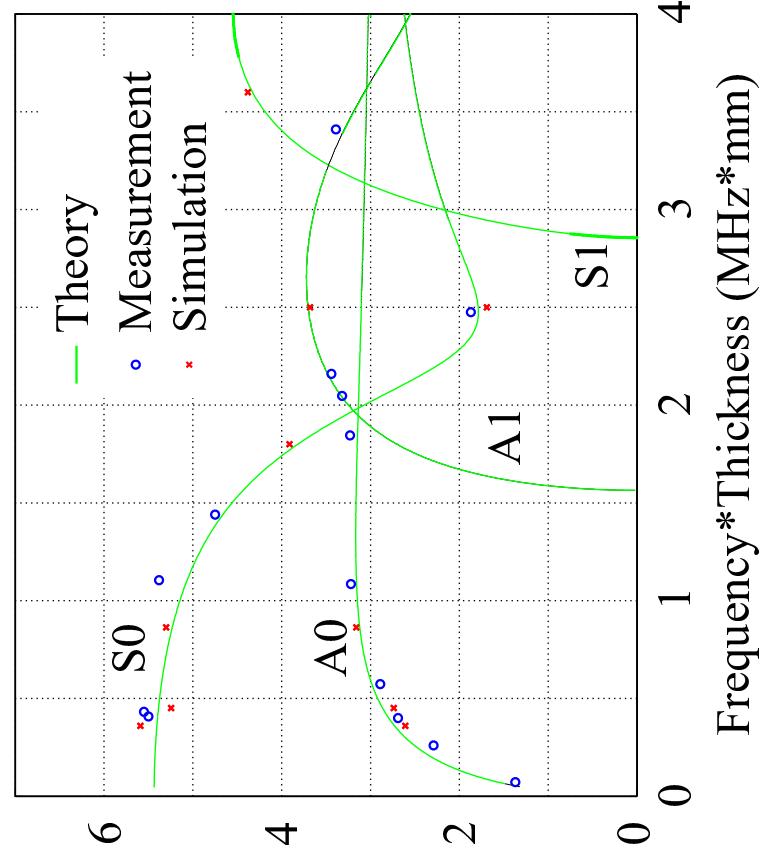

Different FE grids for the mechanical and the magnetic field problem
